

IPO 信息披露冗余复刻：X/Y 描述性统计与 Controls 数据需求

日期：2026-07-06；口径：full543 dewrap_join + GLM-4 tokenizer + cot_v3b_len132_tight + Summary_len_proxy

- X measurement 已基本回到原文量级：chunk 数 8706 vs 8683，企业层 Redundancy 28.944 vs 29.074。
- Y 描述性统计没有明显崩坏：FIvention 接近原文，BHAR 略更负，FSales_Growth 偏低但仍在可解释范围。
- Table 2 回归仍 NO_PASS_YET：FIvention 已接近原文负向，BHAR 和 FSales_Growth 未恢复。
- 下一步不是继续调 X，而是补齐 controls，尤其 Underwriter、NumIndSeg、NumProdSeg、ScopeLen。

1. 当前 X/Y 与原文描述性对比

scope	variable	N	paper N	mean	paper mean	median	paper median
table1_chunk	Chunk_num	8706	8683	17.485	18.191	17.000	16.000
table1_chunk	Summary_len	8706	8683	130.975	132.678	132.000	130.000
table1_chunk	Redundancy_chunk	8706	8683	30.468	32.176	29.294	29.739
table2_xy	lnN_tech	543	552	10.966	10.962	10.979	10.910
table2_xy	Redundancy	543	552	28.944	29.074	28.815	28.910
table2_xy	FIvention	531	471	2.325	2.282	2.197	2.197
table2_xy	BHAR	541	471	-0.062	-0.036	-0.204	-0.170
table2_xy	FSales_Growth	538	471	0.409	0.530	0.156	0.180

Table 2 主规格重跑

Y	N	coef	t	p	paper coef	paper t	read
FIvention	531	-0.0445	-1.88	0.060	-0.0316	-1.72	接近原文负向
BHAR	541	0.0041	0.39	0.699	-0.0188	-2.14	未恢复原文方向
FSales_Growth	538	0.0216	0.59	0.556	-0.0373	-2.02	未恢复原文方向

2. Controls 缺口定位

variable	available	N	paper N	mean	paper mean	median	paper median	status
RD_Staff	False	0	552		0.305		0.240	缺失
RD_Asset	True	541	552	0.079	0.105	0.052	0.073	有但偏低
Size	True	541	552	20.779	20.741	20.569	20.533	基本可用
Lev	True	541	552	0.360	0.356	0.337	0.334	基本可用
ROA	True	541	552	0.091	0.094	0.100	0.100	基本可用
Offerfee	True	542	552	18.327	18.325	18.266	18.270	基本可用但需 Choice 复核
Underwriter	True	543	552	0.009	0.574	0.000	1.000	严重错口径
Age	True	541	552	2.612	2.601	2.660	2.639	基本可用
NumIndSeg	False	0	552		0.854		0.693	缺失
NumProdSeg	False	0	552		1.475		1.609	缺失
ScopeLen	False	0	552		5.671		5.762	缺失

关键判断

原文附录定义显示，模型控制变量包括

Size、Lev、ROA、Offerfee、Underwriter、Age、NumIndSeg、NumProdSeg、ScopeLen，并额外控制 lnN_tech。当前 Size/Lev/ROA/Offerfee/Age/lnN_tech 基本可用；真正会阻断 strict replication 的是 Underwriter 和三个分部/经营范围变量。机制和定价表还需要 RD_Staff，并复核 RD_Asset 与 Price_Issue/Price_Day5。

3. 需要补的数据清单

P0 是复刻 Table 2 必须补齐的数据；P1 是复刻动机/定价机制表必须补齐或复核的数据；P2 是已有但最好用原文来源复核的数据。

prio	variable	needed data	preferred source	fields / construction
P0	Underwriter	IPO sponsor / lead underwriter / main underwriter identities, plus IPO underwriting business ranking.	Choice, because original states issuance institution and issue-fee data are from Choice. CSMAR IPO underwriting detail can be fallback.	stock code, listing date, issue date, sponsor, lead underwriter, main underwriter, underwriter name, underwriting amount or IPO count. Construction: Top-10 IPO underwriters = 1, else 0. Need confirm whether top 10 is market-wide IPO business over 2019-2023 or annual ranking.
P0	NumIndSeg	Business / industry segment table near IPO or listing pre-year.	CSMAR segment information or business composition by industry; prospectus segment table if CSMAR lacks IPO-year coverage.	stock code, report date/year, segment type, industry/business segment name, segment revenue. Construction: Count distinct business/industry segments, then log-transform. Original stats suggest checking $\ln(1 + \text{count})$.
P0	NumProdSeg	Product segment / main product composition table near IPO or listing pre-year.	CSMAR business composition by product; prospectus main product revenue table as fallback.	stock code, report date/year, product segment name, product revenue, revenue share. Construction: Count distinct product segments, then log-transform. Original median 1.609 implies careful check of $\ln(\text{count})$ vs $\ln(1 + \text{count})$.
P0	ScopeLen	Business scope text from company registration/basic information at IPO.	CSMAR listed-company basic information / company registration info; Tianyancha/Qichacha as fallback if CSMAR has no scope text.	stock code, company name, registration date/update date, business scope full text. Construction: Clean whitespace and count Chinese characters, then log length. Original mean 5.671 implies about 290 characters.
P1	RD_Staff	R&D; staff count and total employee count in the pre-IPO reporting period.	CSMAR R&D; innovation / employee structure table; prospectus employee table fallback.	stock code, report year, R&D; staff count, total staff count. Construction: $\text{RD_Staff} = \text{R\&D; staff} / \text{total staff}$. Use pre-listing year or prospectus latest reporting period.
P1	RD_Asset	R&D; expenditure or total R&D; investment, and beginning total assets.	CSMAR R&D; innovation table plus financial statements.	stock code, report year, R&D; expenditure / R&D; investment, beginning total assets, fiscal period type. Construction: $\text{RD_Asset} = \text{R\&D; expenditure} / \text{beginning total assets}$. Verify whether original used expense only or total R&D; input.

prio	variable	needed data	preferred source	fields / construction
P1	Price_Issue / Price_Day5	Issue price, fifth trading day close, NAV per share, industry benchmark mean.	Choice issuance/basic data plus CSMAR daily trading and firm fundamentals; CSMAR IPO first-day performance as cross-check.	stock code, issue price, listing date, daily close, fifth trading day, NAV per share, industry code. Construction: Price / NAV per share, then divide by industry mean. Confirm industry level and whether day 5 counts listing day as day 1.
P2	Offerfee	Issue expenses from Choice, because original states issue institution and issue-fee data are from Choice.	Choice IPO issuance expenses; current CSMAR IPO basic can be retained as fallback.	stock code, issue expenses / total issuance cost, issue date, listing date. Construction: Offerfee = $\ln(\text{issue expenses})$. Keep current if Choice matches.
P2	Size / Lev / ROA / Age / industry FE	No urgent new data; only audit timing and industry classification.	Current CSMAR financial statements and firm_info parquet are acceptable for now.	If re-downloading: balance sheet, income statement, establishment date, CSRC industry code. Construction: Use pre-listing year consolidated statements; Age = $\ln(\text{years from establishment to IPO})$.

最小下一步

先下载或构造 P0 四项：Underwriter、NumIndSeg、NumProdSeg、ScopeLen。若这四项补齐后 Table 2 仍不动，再进入 Y 口径网格和机制表变量重构。
